ABSTRACT
In Indian classical music, there are seven fundamental musical notes known as Swaras. They are namely, “Sa”, “Re”, “Ga”, “Ma”, “Pa”, “Dha”, “Ni”. In this paper, a digital piano has been designed using a microcontroller. It comprises of eight keys for the above notes, along with an eighth note, the upper “Sa”. It is a minimalistic and easy to use piano interfaced with an LCD to provide a visual indication of the Swara being played. Its simplicity and ease of operation, along with a low-cost factor makes it an ideal instrument for beginners. The waveforms can be observed on an oscilloscope and varied for better understanding for the learner. This instrument can also be developed further to form a robust system with more notes and waveforms.

General Terms
Embedded Systems

Microcontroller, Proteus, Keil, Musical notes, LCD

1. INTRODUCTION
In this project, a basic instrument aimed at emulating a piano has been designed, using microcontroller SST89E516RD (of the 8051 family). The controller has 8 buttons connected to one port, and an LCD connected to another. When a button is pressed, the frequency of the musical note that the button corresponds to is converted into an appropriate time delay. This delay is changed to its corresponding hexadecimal value and loaded into the timer of the controller to produce a waveform at the output, which is given to a speaker and amplifier circuit to make the note audible. Simultaneously, on the display of the LCD the note being played appears.

2. LITERATURE SURVEY
The instruments that have been made previously, that are analogous to this, include a piano using timer IC 555 [9] and a piano with LED indicators using PIC microcontroller. In the case of IC 555, sounds of varying frequencies are produced by varying the value of the resistance connected to it in the astable multivibrator mode. The limitation of this implementation is that the exact value of frequencies in an octave cannot be obtained due to restrictions on the practical values of resistors available. Moreover, the waveform of sound produced at the output will always be a square or rectangular wave. For a piano that has previously been implemented using PIC microcontroller, the program to generate the necessary delay is loaded into the controller, however, the note being played is indicated simply by the glowing of an LED placed near each button. Hence this instrument overcomes the drawbacks of both. It not only produces the exact frequency required by loading the corresponding delay into the controller, but also provides a display to enable interaction of the system with the user by indicating which note is being played. The quality of sound produced is the same, as would be for more expensive controllers, thus it serves as an effective alternative to those. Additionally, it is also capable of producing varying sound due to different waveforms such as saw tooth, sine, triangular.

Since we have interfaced the LCD in 4-bit mode, one port of the microcontroller is available for the addition of more buttons, i.e. more musical notes, which is another feature which enhances the potential for development of this instrument.

3. SYSTEM ARCHITECTURE
3.1 Proposed System Block Diagram

3.2 SST89E516RD
This microcontroller belongs to the 8051 family. It is a 40 pin PDIP. It has several applications in embedded system projects in fields like electronics, medicine, communication, making of musical instruments to name a few. The features of this controller that are utilized in this project include its dual block super flash memory of 72 Kbytes (64 Kbytes of a primary block + 8 Kbytes of a secondary block) along with 1k byte internal RAM. It has four I/O ports of 8-bits each. There are three 16-bit Timers/Counters, in this instrument timer 0 is used in mode 1. It has standard 12 clocks per cycle and can be operated at any frequency between 0 to 40 MHz, at a power supply of 5 volts.

3.3 Liquid Crystal Display
The LCD used is JHD162A [7], to give information to the user. It is a 16X2 LCD, with 2 rows and 16 characters per row. Each character is displayed within a 5X7-pixel matrix. This is a 16-pin device, constituting 8 data pins and 3 command pins. It has two registers, namely the command register and data register, used to store commands and data respectively. They can be selected using the command pin RS. When RS = 0 the command register is selected and when RS = 1 the data register is selected. With respect to the data pins, when the LCD is used in 8-bit mode, all 8 data inputs are used. It can also be operated in 4-bit mode, which has been done in this project, where only 4 data pins are used.

3.4 Amplifier and Speaker
A speaker and amplifier circuit is required to make the musical note being played audible to the user. Both are connected at P3.0 of the microcontroller. The output current obtained at the pins of the microcontroller is not sufficient to drive the speaker. The specification of the speaker used is 8Ω, 0.5 Watt, thus its current requirement is 250mA whereas the current provided by the controller is 16mA. For this reason, an amplifier is needed. The amplifier circuit used consists of IC TBA810 [8]. It is a 12 pin IC that can be given a supply voltage of up to 16V. It functions as a class B amplifier and provides an output power of 7 Watt. It gives high output current of 3A, high efficiency (75%) and very low harmonic and crossover distortion. The input signal that is to be amplified is given at pin 8 of the IC, and the amplified output is obtained at pin 12. Thus, the speaker is connected between pin 12 and ground.

4. SYSTEM IMPLEMENTATION
4.1 Calculations and working
Buttons are connected to Port 1 of the controller, LCD at Port 2 and speaker at the first pin of Port 3. Each of the eight buttons correspond to the eight musical notes. When any button is pressed, that pin of Port 1 gets connected to ground. Simultaneously, the note is played through the speaker and displayed on the LCD. This process is implemented using the calculations explained below.

A crystal oscillator of frequency 11.0592 MHz is connected between pin 18 and 19 of the microcontroller. To load the frequency of the notes into the timer of the controller, as an appropriate hexadecimal value, the following steps are followed [2].

Crystal oscillator frequency = 11.0592 MHz Frequency of one machine cycle = \( F = \frac{11.0592}{12} \times 10^6 \) Hz

The delay required in the waveform = \( T = \frac{1}{2(2083.33)} \times 10^6 \) µs. Now, a period of 1.085 µs corresponds to 1 count thus the delay of 2083.33 µs will correspond to the desired count. Thus, the desired count = 2083.33/1.085 = 1920.122 ≈ 1920.

Count to be loaded into timer = max. count – desired count +1 = 65535 – 1920 + 1 = 63616. The hexadecimal value of this number is F880.

The SST89E516RD has three Timers/Counters [1]. Each of these can be used in four different modes of operation. Based on which mode is to be used, the mode bits M1 and M0 are loaded in the TMOD register, for mode 1 the. This project uses Timer 0 in mode 1. For this, the bits loaded in the TMOD register are 0 0 0 0 1 0 0 1. In mode 0 the timer is used in the 16-bit mode. The lower and higher bits of the count to be loaded are placed into the TL0 and TH0 registers respectively, which are 8 bit each. In the example above, 80 is loaded into TF0 and F8 into TH0.

TMOD Register [1]
Once the operation of the timer is complete, the timer overflow flag (TF0), present in the timer control register (TCON), is set to 1 and an interrupt occurs to stop the operation of the timer. In this manner, the sound wave is generated at the first pin of port 3 where the speaker is placed. The table shows the values that are loaded into the Timer 0 register and have been calculated using the procedure explained above.

4.2 Software Implementation

4.2.1 Keil

4.2.1.1 Algorithm

Step 1: Start.
Step 2: Load header files for register 51 in Keil.
Step 3: Load header files for LCD module in 4-bit mode.
Step 4: Initialize buzzer at port 3 of microcontroller.
Step 5: Initialize the delay logic for each note, to load frequencies of the piano in Timer 0 of the microcontroller.
Step 6: Initialize the LCD module.
Step 7: Clear LCD module.
Step 8: Give LCD module a delay.
Step 9: Display string “Piano by Akshr” in the first row of 2X16 LCD module.
Step 10: Check if any button is pressed i.e. any port 1 pin is grounded.
Step 11: If button is pressed go to step 12, else go to step 10.
Step 12: Display note that is being played on second line of LCD.
Step 13: Change state of speaker at P3.0 and call Delay routine for loading that frequency into Timer 0.
Step 14: Go to step 10.

4.2.1.2 Flowchart

```
Start

Initialize speaker at P3.0

Initialize delay function for each note

Initialize LCD module

Display “Piano by Akshr” on first line of LCD

Is any button pressed?

Yes

Display note played on second line of LCD

Call delay function for corresponding note

Sound obtained on speaker by loading frequency value in Timer0

No
```
4.2.2 Proteus
The code was executed in Keil and then a schematic of the circuit was created on Proteus and the Hex. File of the code generated by Keil was loaded into the microcontroller and the circuit was then simulated to produce the desired output.
4.3 Hardware Implementation

The circuit has been implemented on a perforated circuit board. All the individual components which include the SST89E516RD, with all connections have been soldered on to the board as per the circuit. A voltage regulator – 7805 has also been used to give a 5V output to the 8051 since we a 12V adapter is used for the input voltage. This circuit is placed into a metal box on to which the LCD, speaker and buttons - of the press to short type, are fixed and connected to the 8051-circuit underneath. Hence this is made into a portable and simplistic instrument with all the connections concealed underneath so that only the speaker, LCD and buttons are accessible to the user.
5. CONCLUSIONS

Hence, the design and implementation of a simple but effective instrument for learning and recreational purposes has been carried out. Previously a similar instrument has been implemented using analog devices such as IC 555 [9], and now an improved version has been created using a microcontroller.

This product also has the scope for expansion in the future. Since there is an empty port remaining on the controller, additional musical notes can be added. As of now we only have eight Swaras, further, more number of Swaras along with soft and sharp notes can be included. Moreover, the sound being generated is due to a square wave. The microcontroller can be programmed to produce sound due to varying waveforms such as sine, sawtooth, triangular to make it a more advanced and complex instrument. Thus, there is a scope for this product to be developed into a well-equipped commercial instrument.

6. ACKNOWLEDGMENTS

The authors would like to thank the project guide, Dr Amit. Deshmukh, Professor and Head of Department, EXTC DJSCE for his invaluable guidance and support throughout the course of this project.
